

The Carbon Trust Energy Management Service helps organisations to reduce their energy bills and CO2 emissions and comply with environmental legislation.

What we do

We gather data from your energy meters and use specialist software to show how and where you are consuming energy. Our team of experts analyses the data to identify specific issues and opportunities to reduce consumption, and provides advice and guidance on implementing them. In the Carbon Trust's experience, a building's energy consumption can frequently be reduced by up to 10% through better energy management – but only if it receives ongoing attention.

Key benefits

Cutting costs: Energy is a significant and growing cost for many organisations, so reducing consumption can deliver substantial cost savings.

Reducing emissions: By reducing energy consumption, you will also reduce CO2 emissions, helping you to achieve your sustainability objectives.

Facilitating compliance: The service makes it easy to prepare data submissions required by environmental legislation such as ESOS and CRC.

Validating bills: Monitoring energy means that you can easily validate your energy bills to ensure that you are only paying what you should.

Enhancing reputation: Being able to demonstrate emissions reductions can differentiate your brand in a crowded market place.

Engaging staff: The Energy Management Service is a great platform for broader staff engagement on energy efficiency and environmental sustainability.

“By enabling us to visualise our energy consumption, the Carbon Trust’s support means we can manage our building to optimise consumption, reduce costs and improve our environmental impact”

Managing Director, Kongsberg Oil & Gas Technologies Ltd.
